NOTE: The foregoing is supplied as a general information guideline only. This information is specific to the site location listed and collected by highly qualified PCA/Consultants. For optimum pest management decision making, each orchard should be individually monitored with pheromone traps and environmental monitoring equipment.

Mark your calendars for the action date listed below:

AUGUST: PHEROCON® traps should continue to be in the fields and orchards to evaluate late-summer and fall flights of CM, NOW and other pests.

New Product: If you have deployed **CIDETRAK® NOW MESO™** Mating Disruptant for NOW control in conventional and organic California tree nuts: almonds, pistachios, figs and walnuts, it is still working to disrupt mating through harvest.

And, remember, **CIDETRAK® DA MEC™** enhances Codling Moth larval control when mixed in the spray tank with insecticide in conventional and organic walnut orchards.

Dr. Douglas Light, USDA-ARS, Emeritus, “CIDETRAK DA MEC provides a higher level of insecticide efficacy in killing hatched larval worms and protecting the walnut set that the grower currently sees, and counts on, by targeting the Codling Moth 1B, 2nd and the current 3rd flight, as it can still be used in pre-harvest sprays of walnuts. This also adds the benefit of decreasing damaged-nuts for NOW to later infest.”
