NOTE: The foregoing is supplied as a general information guideline only. This information is specific to the site location listed and collected by highly qualified PCA/Consultants. For optimum pest management decision making, each orchard should be individually monitored with pheromone traps and environmental monitoring equipment.

Mark your calendars for the action date listed below:

JUNE: All **PHEROCON®** traps should be placed in the orchards.

New Products: **CIDETRAK® NOW MESO™** Mating Disruptant for NOW control in conventional and organic California tree nuts; almonds, pistachios, figs and walnuts **CIDETRAK® CMDA+NOW MESO™** Mating Disruptant for Codling Moth and NOW control in conventional and organic walnuts.

The second flight of Navel Orangeworm is here and hull split is imminent BUT IT'S NOT TOO LATE to apply **CIDETRAK® NOW MESO™** to obtain significant economic benefit from protection of hull split this year and a high probability of reducing mummy infestations, which will affect the crop next year. **CIDETRAK® NOW MESO™** has been shown to provide excellent results in replicated trials with delayed applications through July. **CIDETRAK® NOW MESO™** is easy to use, contains no moving parts, no batteries and no gummy deposits, which I'm sure your growers will appreciate.

And, remember, **CIDETRAK® DA MEC™** enhances Codling Moth larval control when mixed in the spray tank with insecticide in conventional and organic walnut orchards.

Dr. Douglas Light, USDA-ARS, Emeritus, "CIDETRAK DA MEC provides a higher level of insecticide efficacy in killing hatched larval worms and protecting the walnut set that the grower currently sees, and counts on, by targeting the Codling Moth 1B, 2nd and 3rd flights. This also adds the benefit of decreasing damaged-nuts for NOW to later infest."
